

# Commissioning and performance of the CMS Global Calorimeter Trigger

A. Tapper, J. Brooke, C. Foudas, R. Frazier, M. Hansen, G. Heath, G. Iles, J. Marrouche, A. Rose, G. Sidiropoulos & M. Stettler

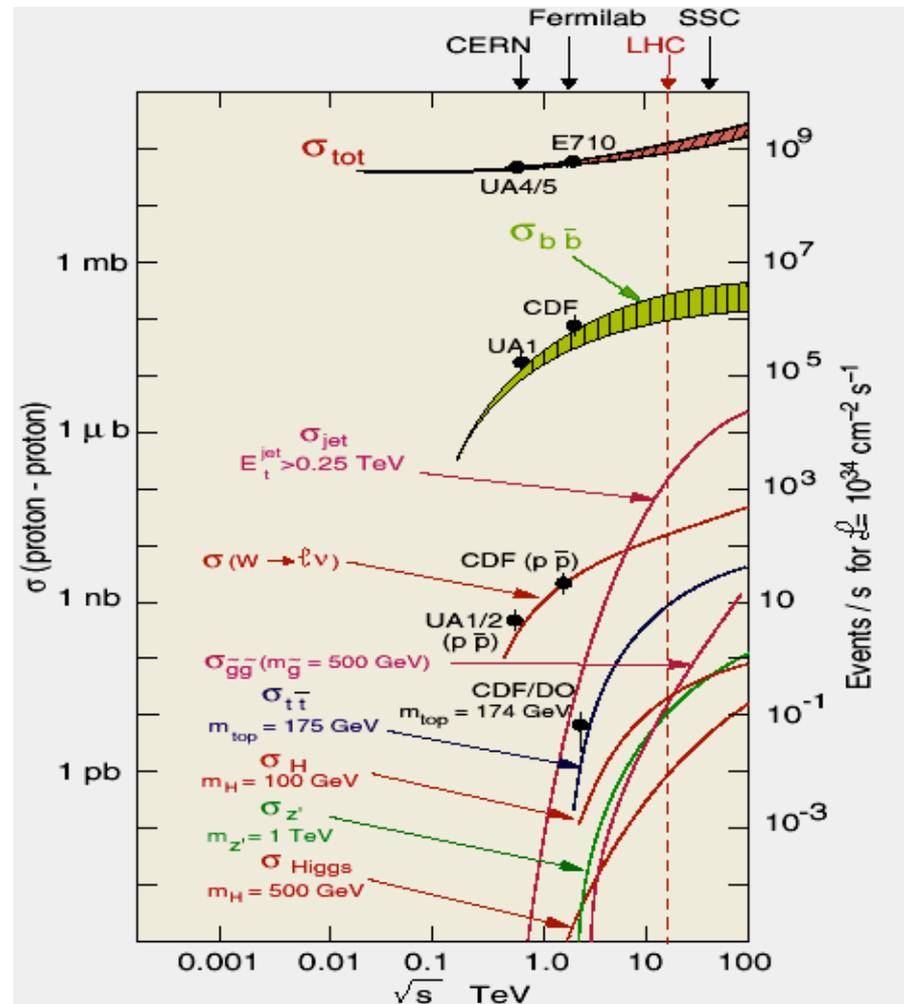

- Trigger challenges and the CMS L1 Trigger
- The Global Calorimeter Trigger
- Status of commissioning and performance

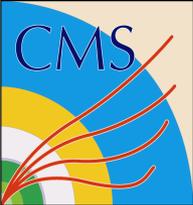

# Trigger challenges at the LHC

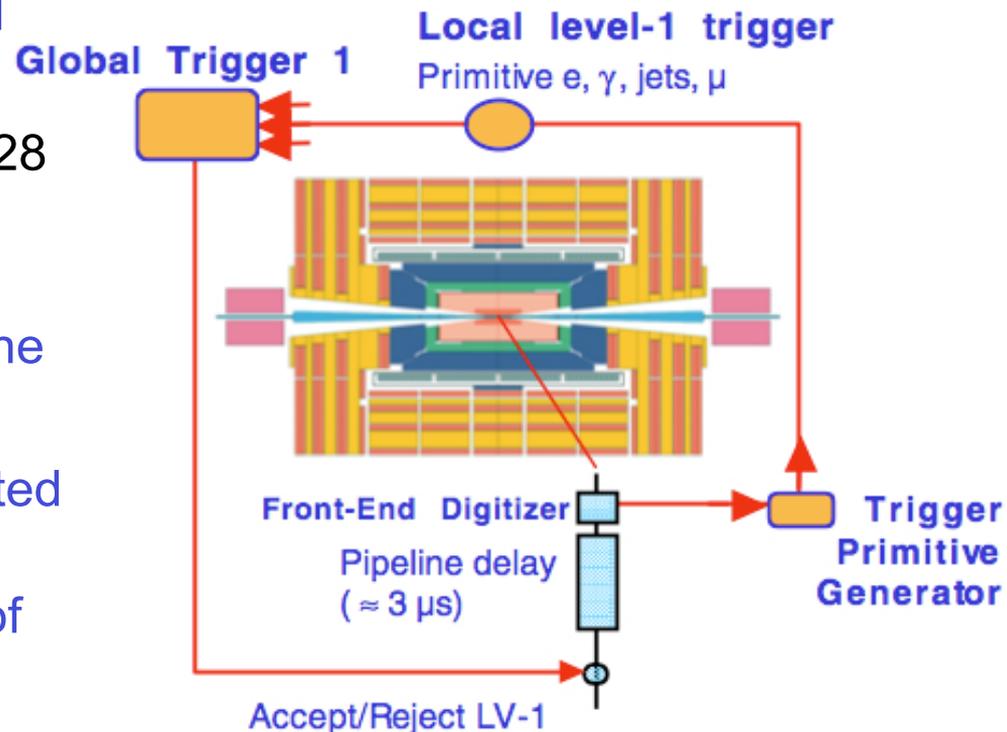

- Enormous data rate:  $10^9$  Hz
  - More than 1TByte/s
- Minimum bias in-time pile-up
  - 22 events per bunch crossing
- Out-of-time pile-up
  - Events from different bunch crossings overlaid
- Tiny cross sections for Higgs and new physics
  - Selection 1:10<sup>11</sup>
- All online
  - Can't go back and fix it. Events are lost forever!

# The CMS Level 1 Trigger

- Detector data stored in front-end pipelines
  - Pipelines deep enough for 128 bunch crossings ( $3.2\mu\text{s}$ )
- Trigger decision derived from trigger primitives generated on the detector
- Trigger systems search for isolated  $e$ ,  $\gamma$ ,  $\mu$ , jets and compute the transverse and missing energy of the event
- Event selection algorithms run on the global triggers
  - Must give a trigger decision every 25ns.

# The CMS Level-1 Trigger

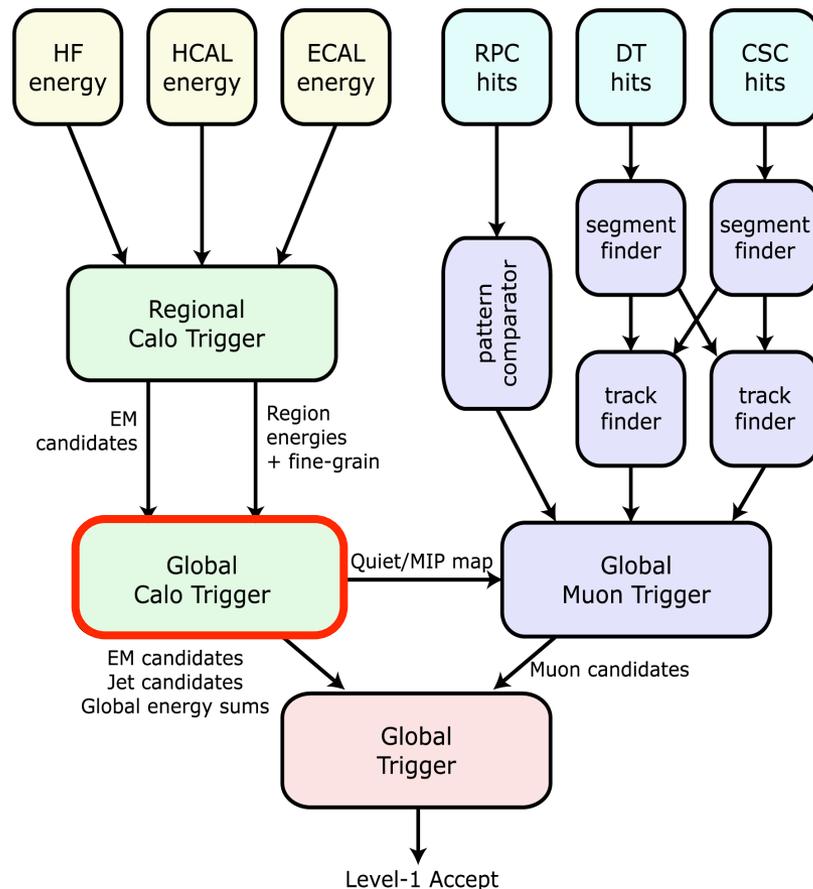

- Muons

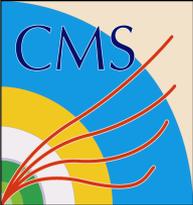

- Three complementary detector systems
- Share hits when available in overlap regions
- Find best combination of information in Global Muon Trigger

- Electrons, jets, energy sums etc.

- Combine ECAL and HCAL energies in Regional Calo Trigger and do local electron finding
- Global energy sums and jets in the **Global Calo Trigger** →

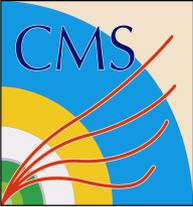

- All objects contribute to L1 accept

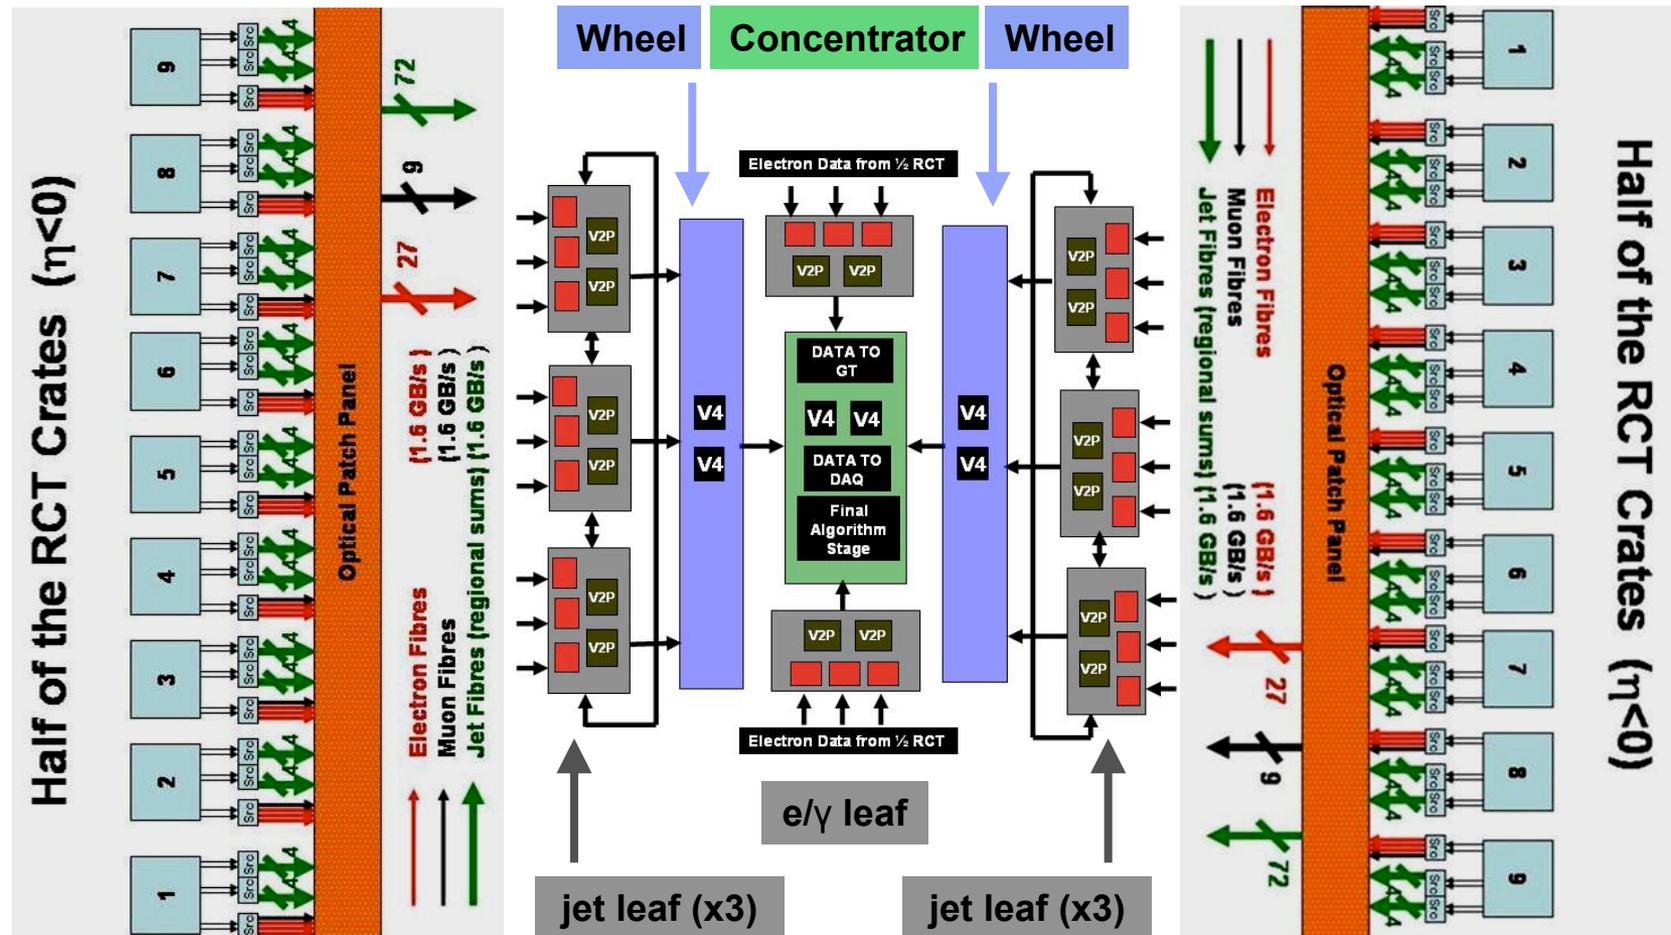

# The Global Calorimeter Trigger

- Jet Triggers:
  - Central, Tau and Forward jet finding and sorting.
- Electron/ $\gamma$  triggers:
  - Select and sort the e/ $\gamma$  candidates from the Regional Calorimeter Trigger
- Energy sums:
  - Total Transverse ( $E_T$ ), Missing Transverse ( $ME_T$ ) and Total Jet Transverse Energy ( $H_T$ ) calculation
- Min bias:
  - Sum rings and count towers above threshold in forward calorimeters to form minbias trigger
- Other tasks:
  - Receive the muon data and send them to the Global Muon Trigger (separate system based on  $\mu$ TCA hardware)
  - Readout all the RCT and GCT data for every L1 accept

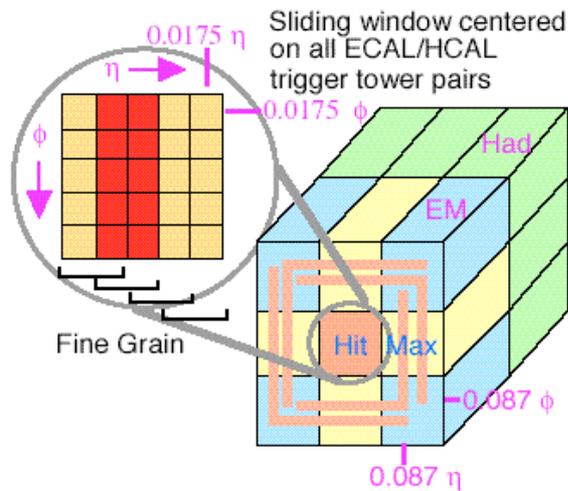

# The Global Calorimeter Trigger

# L1 trigger algorithms

## Electron/photon finder

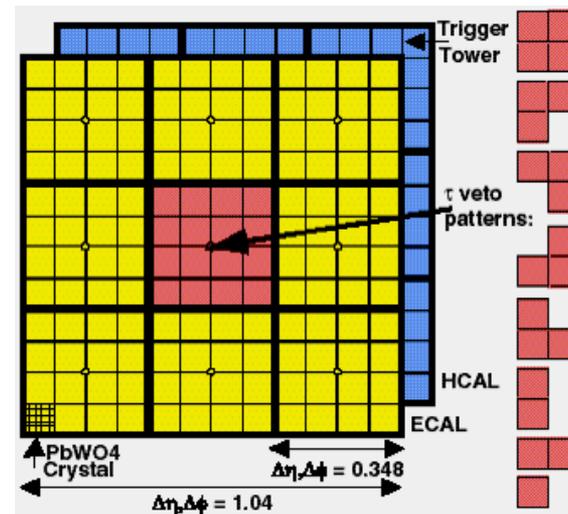

### • Electron (Hit Tower + Max)

- 2-tower  $\Sigma E_T$  + Hit tower H/E
- Hit tower 2x5-crystal strips  $>90\%$   $E_T$  in 5x5 (Fine Grain)

### • Isolated Electron (3x3 Tower)

- Quiet neighbours: all towers pass Fine Grain and H/E
- One group of 5 EM  $E_T <$  threshold

## Jet Finder

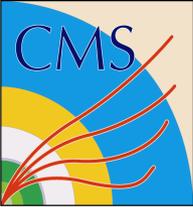

### • Jet $E_T$

- 12x12 trigger tower  $\Sigma E_T$  sliding in 4x4 steps
- Central 4x4  $E_T >$  others

### • Tau jet

- Isolated narrow energy deposit
- Energy outside veto pattern sets veto
- Jet is tau if all nine 4x4 region vetoes off

# Status and commissioning

Three stages of commissioning planned:

- Pattern tests

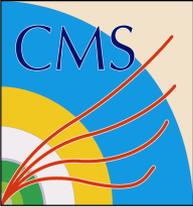

- Simple patterns to verify cabling map
- Full Monte Carlo simulated events loaded into hardware. Compare to what is expected by software (C++) emulator.

- Cosmic tests

- Run with cosmic-ray muons triggered by muon system or calorimeters
- Compare to what is expected by emulator (comparison run online in DQM stream)

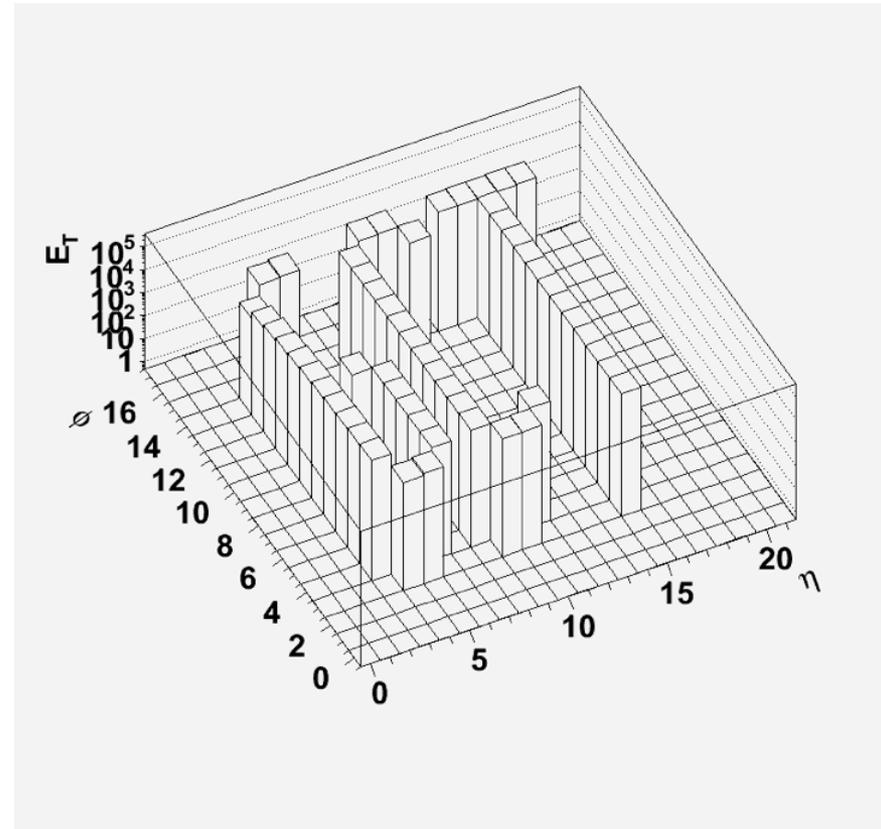

- ~~First running~~

- ~~Single beam (beam gas and beam halo) events~~
- ~~First collision data!~~

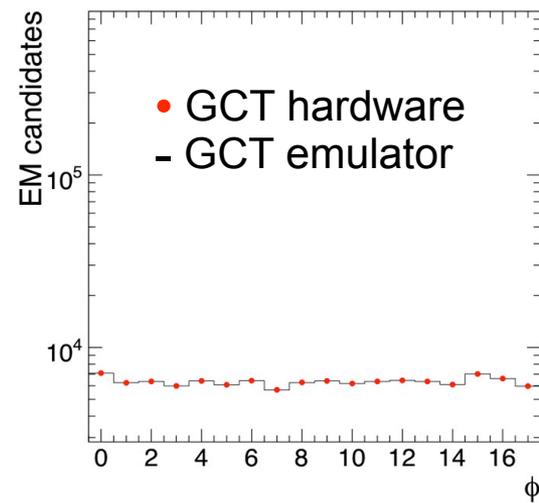

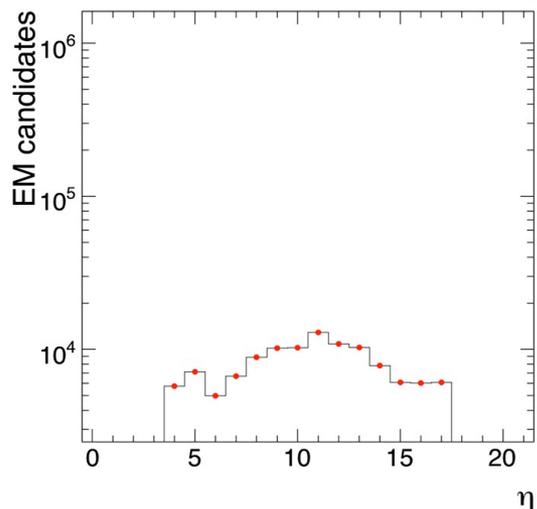

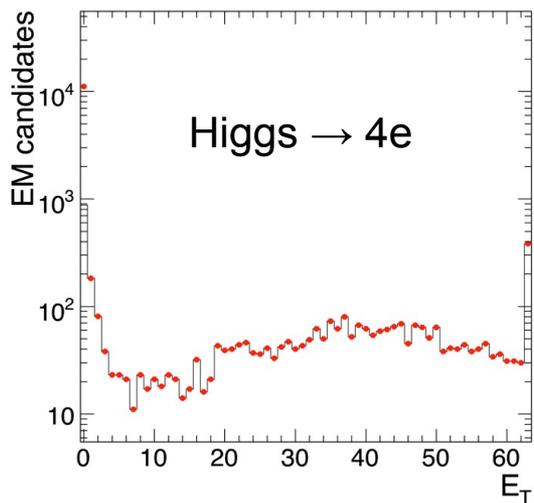

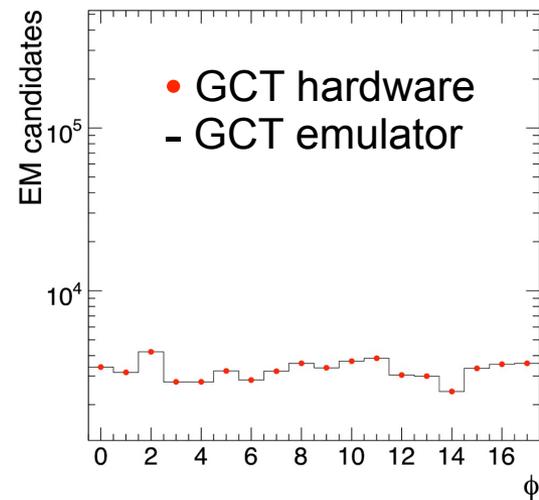

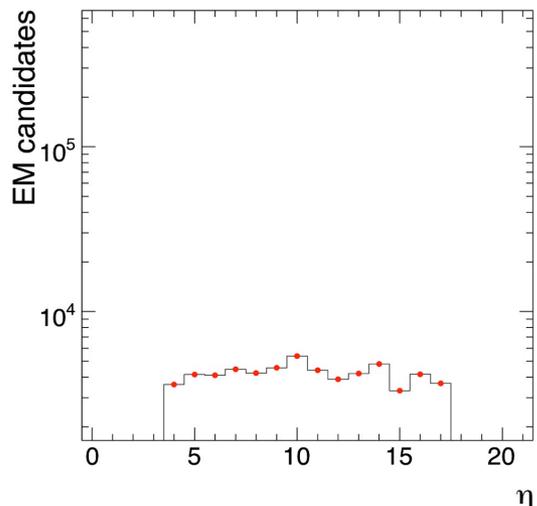

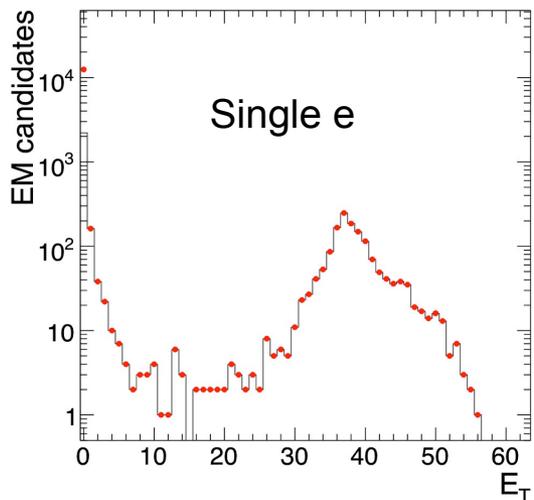

# Pattern tests

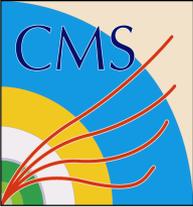

- Comprehensive suite of test patterns, from simple to complex
  - For cabling an ID pattern
  - Random numbers, walking ones etc. for hardware corruption
  - For geometry various patterns with single towers of energy, building up to a fun example →
  - For algorithms groups of energy to test clustering, special cases at boundaries etc.
  - Finally full Monte Carlo events → next page.....

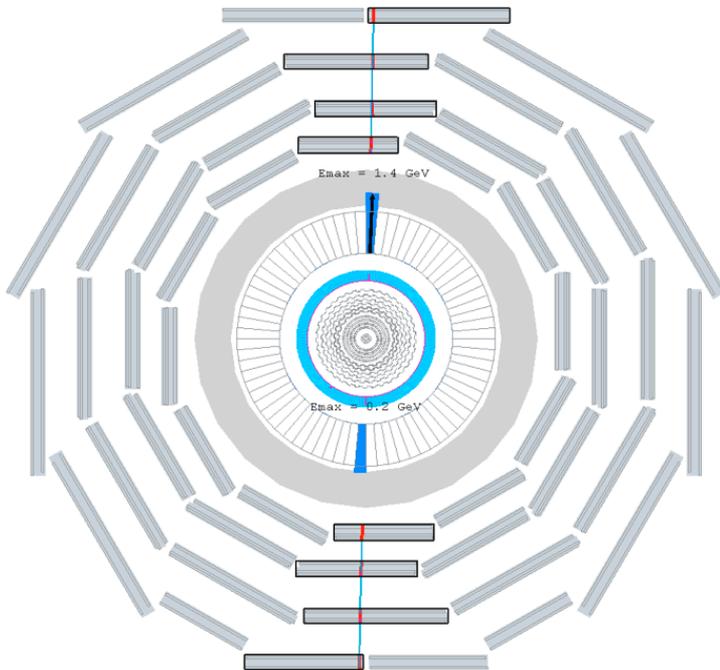

# Pattern tests

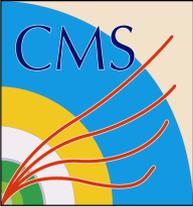

# Cosmic muon running

- Trigger on cosmic-ray muons
  - Muon chambers
  - MIP in ECAL or HCAL
- Commissioned electron trigger in November '07
- Working on jet triggers now
- Some examples from a recent run →

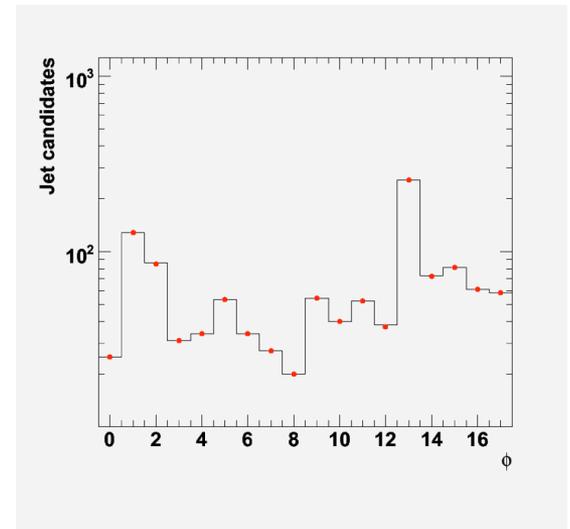

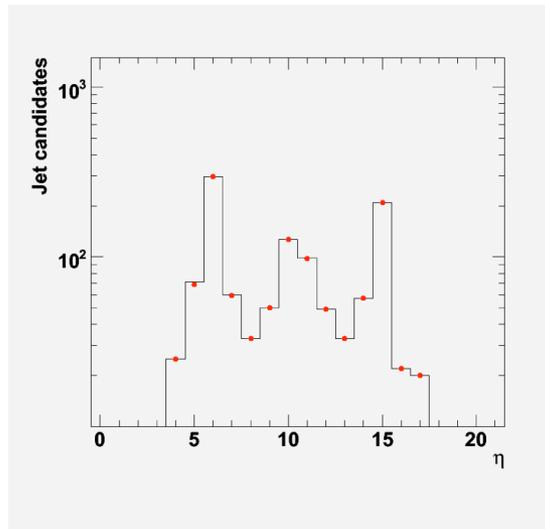

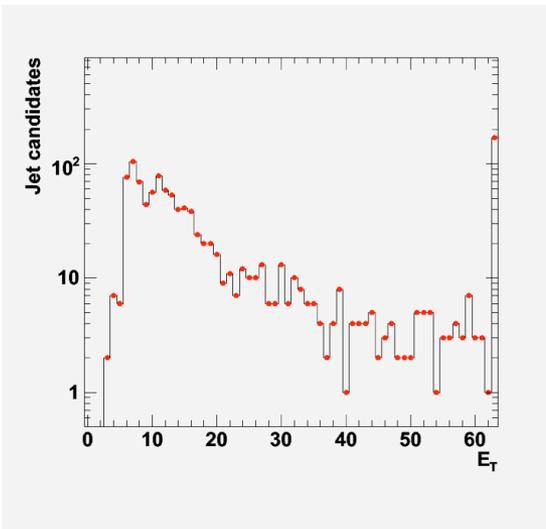

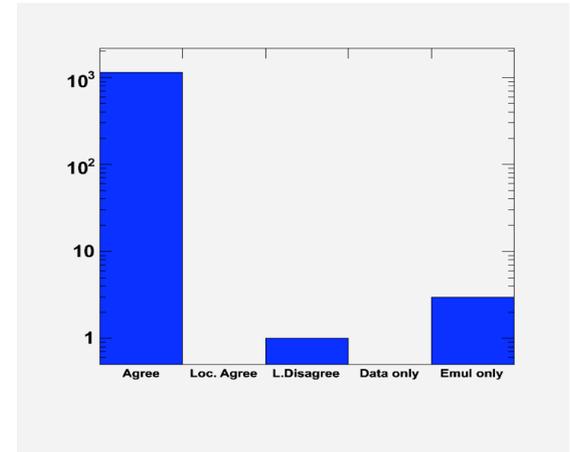

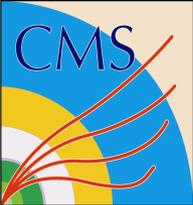

# Cosmic muon running

- Central jets ( $|\eta| < 3$ )

- GCT hardware
- GCT emulator

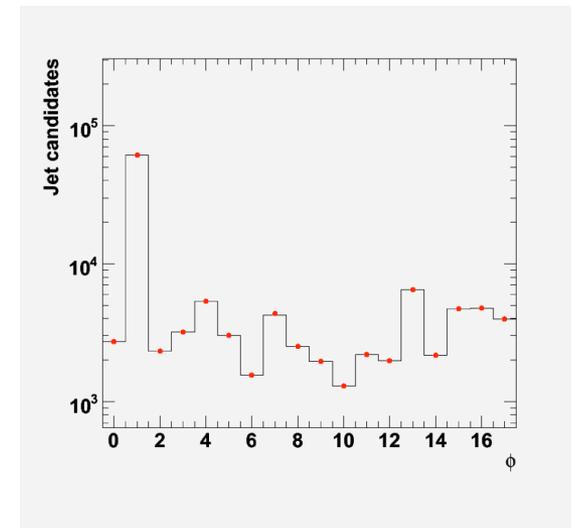

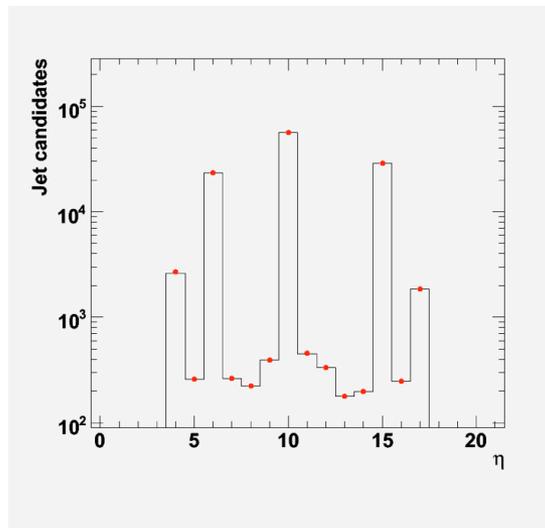

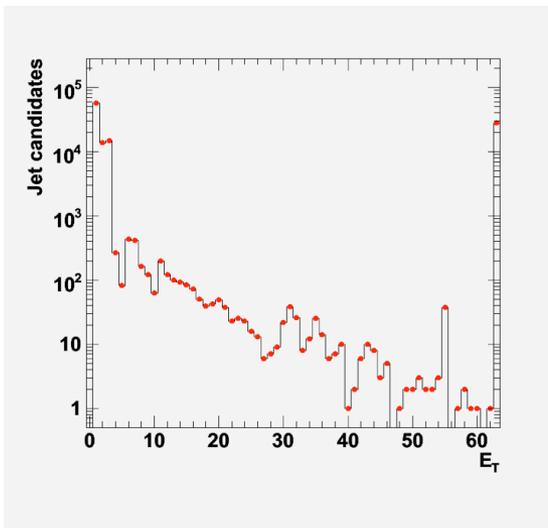

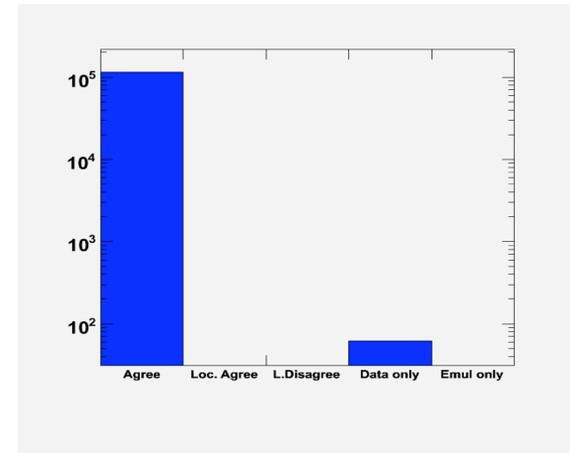

# Cosmic muon running

- Tau jets ( $|\eta| < 3$ )

- GCT hardware
- GCT emulator

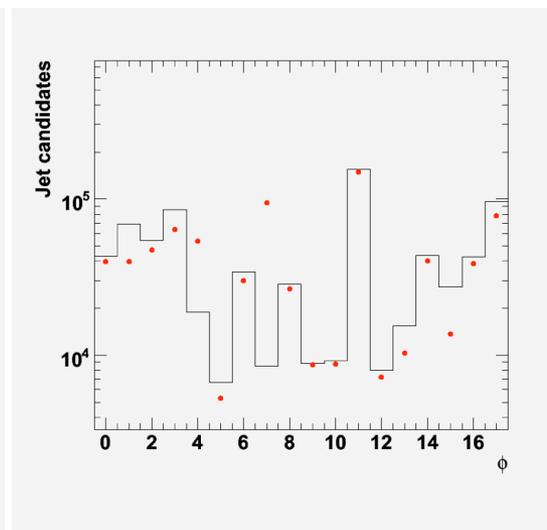

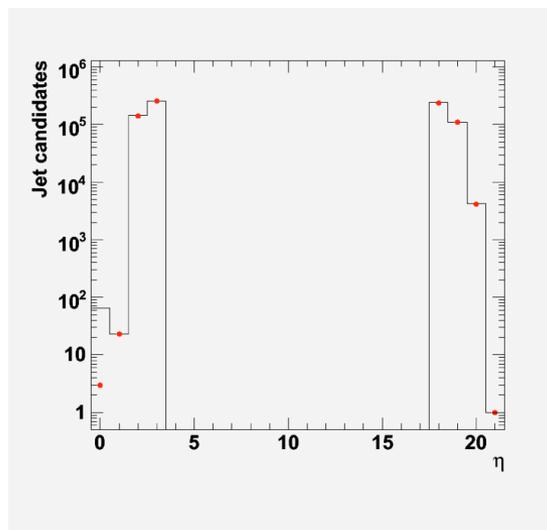

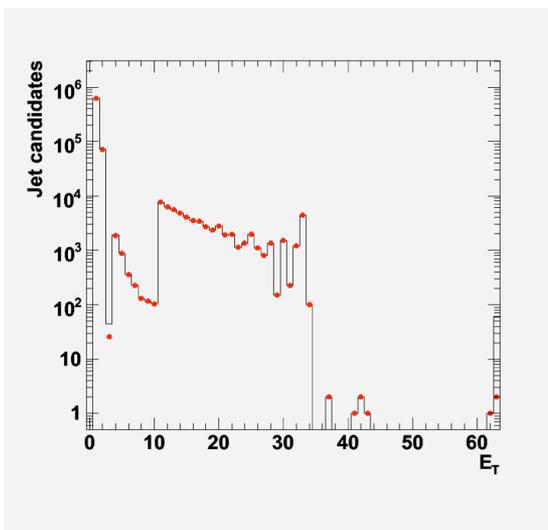

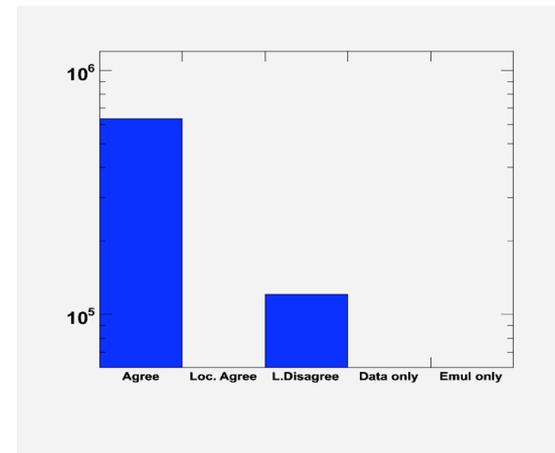

# Cosmic muon running

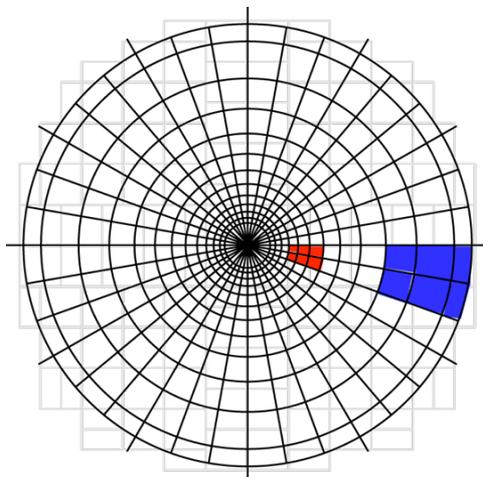

- Forward jets ( $3 < |\eta| < 5$ )

- GCT hardware
- GCT emulator

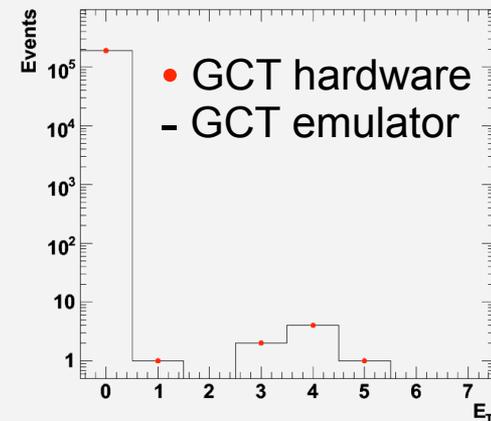

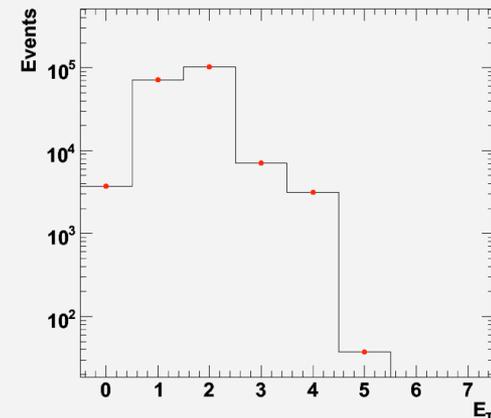

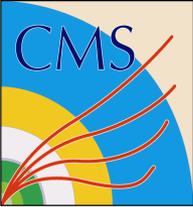

# Cosmic muon running

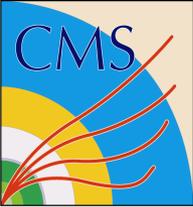

- New idea for triggering low  $P_T$  events in early running
  - Consider inner two rings of trigger towers in the forward calorimeter
  - Make  $E_T$  sums and count towers over  $E$  threshold
  - Make coincidence in  $+/- \eta$

# Future plans

- Missing  $E_T$ ,  $H_T$  and total  $E_T$  implemented
  - Need to be fully commissioned with patterns and cosmic data
  - That would complete the baseline specification
- Already implemented one new idea along the way, others waiting in the wings
  - Missing  $E_T$  from jets  $\rightarrow$  Missing  $H_T$  ( $MH_T$ )
  - Hope is that  $MH_T$  will be more robust in the face of noise and bad beam conditions than  $ME_T$  and therefore particularly valuable in early running
  - Tau algorithm can be better optimised with more isolation
- Flexible enough to react to new ideas and conditions

# Summary

- System runs stably and reliably
  - Huge amount of hardware detail omitted
- Electron, jet and minimum bias triggers commissioned
  - Tracking down final <1% bugs
- Missing  $E_T$ ,  $H_T$  and total  $E_T$  implemented
  - Currently commissioning with cosmic muon data
- Baseline project almost finished, what we've found
  - Complex system designed and built in a quite short timescale
  - Since the firmware is complicated commissioning by comparison with software emulator has been enormously important
  - Huge flexibility in system allows improvements in algorithms and new ideas to be implemented → a blessing for CMS but a curse for us... already new ideas in the pipeline
- Looking forward to data from the LHC!
